Has your child been prescribed antibiotics for an infection?

We're studying whether HMO supplements can help support the gut health of children taking antibiotics.

This may promote healthier weights, skin and lungs.

We're looking for children who:

- › Are 12 to 15 months old.
- › Are starting oral antibiotics.
- › Have mostly stopped taking breastmilk or formula.
- › Live in the Auckland region.

What's involved in the study:

- › Your child will be given a blend of HMOs or a placebo alongside antibiotics.
- › HMOs are a type of complex sugar found naturally in breastmilk. HMO supplements can now be manufactured.
- › 6-monthly check-ins with our research team over 18 months.

Participant costs will be reimbursed.
